# PLUGGED IN

Good afternoon everyone, and welcome to the ninth entry of *Plugged In*.

During the meeting on March 7th, the mechanical continued assembly on the winch mechanism. The electrical team helped the mechanical team with the winch and designed the electronic system for it. The communications team worked on the thank you letter to BayPort Credit Union for the grant received last week. The crew working on the pit robot worked on assembling the body and started building the arms.

During the meeting on March 9th, both mechanical and electrical fast-tracked production on the winch. The drive team lent assistance wherever they were needed. The members working on the robot statue constructed the body and the arms.

During the meeting on March 10th, the programming team rewrote the code to refine certain issues and make more actions easier to do. The mechanical and electrical teams worked on installments meant to be attached to the robot at a later date. As for the status of the cardboard robot statue, the main body, head and arms were painted, along with the start of constructing of the legs and feet.
